DETAILED ACTION

1. Claim 25 is newly added. Claims 16-19 are previously canceled. Therefore, claims 1-15 and 20-25 are presented for further examination.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

3. Claims 1-3, 11, 13, 21 and 23 are rejected under 35 U.S.C. § 102(e) as being anticipated by Hiscock, U.S. Pat. No. 6,721,787.

Regarding claim 1, Hiscock teaches a personal wireless network (= wireless link (22) system) [see Fig. 1 and Col. 2, Line 60 to Col. 3, Line 12], comprising :

a wireless server (= hot-sync server (10)) [see Fig. 1 and Col. 2, Lines 60-66] capable of executing any one of a plurality of software applications and generating from

Serial Number: 09/773,885

Art Unit: 2155

Paper Dated 20050513

Page 3

such execution a plurality of data packets for transmission in the network [see Col. 3, Lines 34-43]; and

a wireless client capable of wireless communication with the wireless server in accordance with at least one wireless communication protocol, the wireless client being configured to remotely access the software applications executed by the wireless server, and to process the data packets transmitted from the wireless server and wherein the wireless server receives a data packet from the wireless client extracts data from the received data packet, and associates the extracted data with one of the software application (= one of personal digital assistance (PDA) (12) is coupled to the hot-sync server (10) by a wireless link (22) wherein the hot-sync server includes a wireless transceiver (46) for communicating with the PDA and the PDA also includes a wireless transceiver (36) for communicating with the hot-sync server and wherein software running in the server to allow exchanging packet data between the PDA and the server for establishing connection) [see Fig. 2 and Abstract and Col. 3, Lines 21-43 and Col. 4, Lines 5-60].

Regarding claim 2, Hiscock further teaches the wireless communication is implementable through a Bluetooth protocol (i.e., the PDA (12) and hot-sync server (10) communicate over a wireless link (22) using a wireless communication protocol referred to by the name "Bluetooth") [see Col. 2, Line 66 to Col. 3, Line 4].

Regarding claim 3, Hiscock further teaches the wireless communication is implementable through an IEEE 802.11 protocol (i.e., the PDA (12) and hot-sync server

Serial Number: 09/773,885

Art Unit: 2155 Paper Dated 20050513

Page 4

(10) communicate over a wireless link (22) using a standard communication protocol such as IEEE standard 802.11) [see Col. 2, Line 66 to Col. 3, Line 2].

Regarding claim 11, Hiscock further teaches a second wireless client capable of wireless communication with the wireless server, and wherein both clients are capable of simultaneously accessing the same software application being executed by the server (= one of personal digital assistance (PDA) (12) is coupled to the hot-sync server (10) by a wireless link (22) wherein the hot-sync server includes a wireless transceiver (46) for communicating with the PDA and the PDA also includes a wireless transceiver (36) for communicating with the hot-sync server and wherein software running in the server to allow exchanging packet data between the PDA and the server for establishing connection) [see Fig. 2 and Abstract and Col. 3, Lines 21-43 and Col. 4, Lines 5-60].

Regarding claim 13, Hiscock further teaches the server is in communication with a Local Area Network (i.e., the hot-sync server is connected to the LAN) [see Col. 3, Lines 7-20].

Claims 21 and 23 are rejected under the same rationale set forth above to claim 1.

Claim Rejections - 35 USC § 103

Art Unit: 2155 Paper Dated 20050513

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

5. Claims 4-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hiscock, U.S. Pat. No. 6,721,787 in view of Haartsen, U.S. Pat. No. 6,590,928.

Regarding claim 4, Hiscock does not explicitly teach the wireless communication is implementable at approximately 2.4 GHz. However, Hiscock does suggest the implementation of suitable wireless protocol for communication between server (hotsync server (10)) and client (the PDA (12) over a wireless link (22) using a standard IEEE 802.11 protocol or a wireless communication protocol such as Bluetooth [see Col. 2, Line 66 to Col. 3, Line 4].

Art Unit: 2155 Paper Dated 20050513

Haartsen, in the same field of wireless communication network endeavor, discloses wireless local area network (WLAN) using a standard IEEE 802.11 protocol wherein the system is operated in the 2.4 GHz band [see Haartsen, Col. 1, Line 40 to Col. 2, Line 40]. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to incorporate the use of a standard IEEE 802.11 protocol wherein the system is operated in the 2.4 GHz band, disclosed by Haartsen, into the system of wireless communication network disclosed by Hiscock, in order to provide a short-range and low-cost wireless communication link for use between devices within a rather small local area such as in-home network.

Regarding claim 5, Hiscock does not explicitly teach the wireless communication is implementable at approximately 5.2 GHz. However, Hiscock does suggest the implementation of suitable wireless protocol for communication between server (hotsync server (10)) and client (the PDA (12) over a wireless link (22) using a standard IEEE 802.11 protocol or a wireless communication protocol such as Bluetooth [see Col. 2, Line 66 to Col. 3, Line 4].

Haartsen, in the same field of wireless communication network endeavor, discloses High Performance Radio Local Area Network (HIPERLAN) using a standard IEEE 802.11 protocol wherein the system is operated in the 5.2 GHz band [see Haartsen, Col. 13, Lines 14-38]. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to incorporate the use of a standard IEEE 802.11 protocol wherein the system is operated in the 5.2 GHz band, disclosed by

Art Unit: 2155 Paper Dated 20050513

Haartsen, into the system of wireless communication network disclosed by Hiscock, in order to provide a short-range and low-cost wireless communication link for use between devices within a rather small local area such as in-home network.

6. Claims 6-7 and 14-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hiscock, U.S. Pat. No. 6,721,787 in view of Treyz et al (Hereafter, Treyz), U.S. Pat. No. 6,678,215.

Regarding claim 6, Hiscock does not explicitly teach the wireless communication is implementable through a HomeRF protocol. However, Hiscock does suggest the implementation of suitable wireless protocol for communication between the hot-sync server (10) and PDA (12) [see Hiscock, Col. 2, Line 60 to Col. 3, Line 4].

Treyz, in the same field of wireless communication network endeavor, discloses in-home wireless network using wireless protocol such as a HomeRF protocol [see Treyz, Fig. 2 and Col. 9, Line 66 to Col. 10, Line 24 and Col. 10, Line 48 to Col. 11, Line 12]. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to incorporate the use of HomeRF protocol, disclosed by Treyz, into the system of wireless communication network disclosed by Hiscock, in order to provide a short-range and low-cost wireless communication link for use between devices within a rather small local area such as in-home network [see Treyz, Col. 10, Lines 20-24 and Col. 11, Lines 1-12].

Art Unit: 2155 Paper Dated 20050513

Regarding claim 7, Hiscock does not explicitly teach the wireless communication is implemented through a plurality of wireless protocols. However, Hiscock does suggest the implementation of suitable wireless protocol for communication between the hot-sync server (10) and PDA (12) [see Hiscock, Col. 2, Line 60 to Col. 3, Line 4].

Treyz, in the same field of wireless network communication endeavor, discloses in-home wireless network using a variety of wireless protocols [see Treyz, Fig. 2 and Col. 9, Line 66 to Col. 10, Line 24 and Col. 10, Line 48 to Col. 11, Line 12]. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to incorporate the use of a variety of wireless protocols, disclosed by Treyz, into the system of wireless communication network disclosed by Hiscock, in order to provide a short-range and low-cost wireless communication link for use between devices within a rather small local area such as in-home network [see Treyz, Col. 10, Lines 20-24 and Col. 11, Lines 1-12].

Regarding claim 14, Hiscock does not explicitly teach the server is an Internet-enabled device. However, Hiscock does suggest the implementation of suitable wireless protocol for communication between the hot-sync server (10) and PDA (12) [see Hiscock, Col. 2, Line 60 to Col. 3, Line 4]. In addition, Hiscock further suggests the hot-sync server (10) may connect directly to the LAN or through other devices such as routers (not shown) [see Hiscock, Col. 3, Lines 7-9].

Treyz, in the same field of wireless network communication endeavor, discloses in-home wireless network using a variety of wireless protocols [see Treyz, Fig. 2 and

Art Unit: 2155 Paper Dated 20050513

Col. 9, Line 66 to Col. 10, Line 24 and Col. 10, Line 48 to Col. 11, Line 12]. In addition, Treyz further discloses residential gateway (45) acting as a server in communication with wireless client devices (12) and extending connection to the Internet via cable modem or DSL link for downloading data. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to implement the server as an Internet-enabled device, disclosed by Treyz, into the system of wireless communication network disclosed by Hiscock, in order to enable the server extending data access to other networks as part of WAN for periodically obtaining data over the Internet in a relatively easy manner [see Treyz, Col. 11, Lines 1-22].

Regarding claim 15, Hiscock does not explicitly teach the server is a personal computer (PC). However, it would have been obvious to one skilled in the art to implement a personal computer as a server for communication with another computer or device as a client in the network.

7. Claims 8, 22 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hiscock, U.S. Pat. No. 6,721,787 in view of Jones et al (Hereafter, Jones), U.S. Pat. No. 6,108,314.

Regarding claim 8, Hiscock does not explicitly teach a wireless router being wirelessly coupled between the server and the client via a wireless protocol. However, Hiscock does suggest one of personal digital assistance (PDA) (12) is coupled to the hot-sync server (10) by a wireless link (22) wherein the hot-sync server includes a

Art Unit: 2155 Paper Dated 20050513

wireless transceiver (46) for communicating with the PDA and the PDA also includes a wireless transceiver (36) for communicating with the hot-sync server [see Hiscock, Fig. 2 and Abstract and Col. 3, Lines 21-43]. In addition, Hiscock further suggests the hot-sync server (10) may connect to the LAN through other devices such as routers (not shown) [see Hiscock, Col. 3, Lines 7-9].

Jones, in the same field of wireless communication network endeavor, discloses the implementation of wireless router between devices such as subscriber devices and servers in the wireless network [see Jones, Fig. 1 and Col. 2, Line 40 to Col. 3, Line 3]. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to incorporate the use of a wireless router, disclosed by Jones, into the system of wireless communication network disclosed by Hiscock, in order to perform routing protocols and handle transmission of different types of data [see Jones, Col. 3, Line 62 to Col. 4, Line 21]. Thus, various types of data can be efficiently transferred from one device to another in a wireless communication environment.

Claims 22 and 24 are rejected under the same rationale set forth above to claim 8.

8. Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hiscock, U.S. Pat. No. 6,721,787 in view of Callaway, Jr. (Hereafter, Callaway), U.S. Pat. No. 6,711,380.

Art Unit: 2155 Paper Dated 20050513

Regarding claim 9, Hiscock does not explicitly teach the client is a wireless smart client. However, Hiscock does suggest one of personal digital assistance (PDA) (12) is coupled to the hot-sync server (10) by a wireless link (22) wherein the hot-sync server includes a wireless transceiver (46) for communicating with the PDA and the PDA also includes a wireless transceiver (36) for communicating with the hot-sync server [see Hiscock, Fig. 2 and Abstract and Col. 3, Lines 21-43].

Callaway, in the same field of wireless communication network endeavor, discloses the implementation of a home wireless network connecting intelligent appliances [see Callaway, Col. 1, Lines 14-45]. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to incorporate the use of wireless smart client (= intelligent appliance), disclosed by Callaway, into the system of wireless communication network disclosed by Hiscock, in order to create a "master-slave" environment in the wireless LAN for the piconet master (= one of controller device (11), (13), (15)) wirelessly controlling and managing all complex operations and program, such that the smart appliance (= slave microwave oven (10)) does little more than acts on very specific commands issued by the master device (for example, turns itself on and off) [see Callaway, Col. 3, Line 13 to Col. 4, Line 5]. Thus, this enables to establish an autonomous local area distributed network like "smart appliances" home network in a configuration that requires only low cost, low bandwidth communication techniques and only an occasional connection to a remote server or a master controller.

Art Unit: 2155 Paper Dated 20050513

9. Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hiscock, U.S. Pat. No. 6,721,787 in view of McClard et al (Hereafter, McClard), "Unleashed: Web Tablet Integration into the Home", ACM, April 2000.

Regarding claim 10, Hiscock does not explicitly teach the client is a wireless tablet. However, Hiscock does suggest the implementation of clients as PDAs (12) [see Hiscock, Fig. 1 and Col. 2, Line 60 to Col. 3, Line 12].

McClard, in the same field of wireless communication network endeavor, discloses the implementation of client as a wireless tablet [see McClard, Page 1, Left column, third paragraph and Page 1, Right column, second & third paragraphs]. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to incorporate the use of a client as a wireless tablet, disclosed by McClard, into the system of wireless communication network disclosed by Hiscock, in order to improve the portability aspect by allowing the user to be unchained and mobilized within a small local area such as in-home network [see McClard, Table 1 on Page 2].

10. Claim 12 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hiscock, U.S. Pat. No. 6,721,787 in view of Nevo et al (Hereafter, Nevo), U.S. Pat. No. 6,600,726.

Regarding claim 12, Hiscock does not explicitly teach the client is capable of wireless communication using a first wireless protocol and the second client is capable of wireless communication using a second wireless protocol. However, Hiscock does

Art Unit: 2155 Paper Dated 20050513

suggest the implementation of suitable wireless protocol for communication between hot-sync server (10) and PDA (12) [see Hiscock, Col. 2, Line 60 to col. 3, Line 4].

Nevo, in the same field of wireless communication network endeavor, discloses one client or device is capable of operation using a first wireless protocol (= wireless network protocol A) and the second client or device is capable of operation using a second wireless protocol (= wireless network protocol B) [see Nevo, Fig. 1 and Col. 3, Lines 30-45 and Col. 4, Lines 36-59]. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to incorporate the implementation of different devices capable of operation using different wireless protocols, disclosed by Nevo, into the system of wireless communication network disclosed by Hiscock, in order to enable a device handling concurrent wireless communication with multiple partners of different wireless communication protocols in a very efficient and low cost manner [see Nevo, Col. 1, Lines 58-60].

11. Claim 20 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hiscock, U.S. Pat. No. 6,721,787 in view of Thompson et al (Hereafter, Thompson), U.S. Pat. No. 6,484,011.

Regarding claim 20, Hiscock does not explicitly teach the wireless client is capable of reading a magnetic strip. However, Hiscock does suggest one of personal digital assistance (PDA) (12) is coupled to the hot-sync server (10) by a wireless link (22) wherein the hot-sync server includes a wireless transceiver (46) for communicating

Art Unit: 2155 Paper Dated 20050513.

with the PDA and the PDA also includes a wireless transceiver (36) for communicating with the hot-sync server [see Hiscock, Fig. 2 and Abstract and Col. 3, Lines 21-43].

Thompson, in the same field of wireless communication network endeavor, discloses the implementation of a wireless device having means for reading a magnetic stripe [see Thompson, Col. 10, Lines 19-21]. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to incorporate the use of wireless device capable of reading a magnetic stripe, disclosed by Thompson, into the system of wireless communication network disclosed by Hiscock, in order to enhance the process of identification in an efficient manner by allowing a quick retrieval of coded information from the magnetic stripe using a portable and wireless device.

12. Claim 25 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hiscock, U.S. Pat. No. 6,721,787 in view of Gershman et al, U.S. Pat. No. 6,356,905.

Regarding claim 25, Hiscock teaches a personal wireless network (= wireless link (22) system) [see Fig. 1 and Col. 2, Line 60 to Col. 3, Line 12], comprising:

a wireless server (= hot-sync server (10)) [see Fig. 1 and Col. 2, Lines 60-66] capable of executing any one of a plurality of software applications and generating from such execution a plurality of data packets for transmission in the network [see Col. 3, Lines 34-43]; and

a wireless client capable of wireless communication with the wireless server in accordance with at least one wireless communication protocol, the wireless client being configured to remotely access the software applications executed by the wireless

Art Unit: 2155 Paper Dated 20050513

server, and to process the data packets transmitted from the wireless server and wherein the wireless server receives a data packet from the wireless client extracts data from the received data packet, and associates the extracted data with one of the software application (= one of personal digital assistance (PDA) (12) is coupled to the hot-sync server (10) by a wireless link (22) wherein the hot-sync server includes a wireless transceiver (46) for communicating with the PDA and the PDA also includes a wireless transceiver (36) for communicating with the hot-sync server and wherein software running in the server to allow exchanging packet data between the PDA and the server for establishing connection) [see Fig. 2 and Abstract and Col. 3, Lines 21-43 and Col. 4, Lines 5-60].

Though Hiscock discloses software (implicitly software applications) running on the server and executed by the processor as indicated, Hiscock does not explicitly disclose a multiple software applications. However, Gershman, in the same field of thin client and wireless server communication endeavor, discloses running and executing a plurality of software applications and modules on the server [see Col. 49, Line 16 to Col. 50, Line 27]. It would have been obvious to one of ordinary skilled in the art at the time of the invention was made to incorporate the teaching of Gershman into the teaching of Hiscock in order to explicitly point out that execution of multiple software applications on the server is known in the art for allowing smooth and efficient communication between client and server.

Art Unit: 2155 Paper Dated 20050513

Response to Arguments

13. Applicant's arguments have been fully considered but they are not persuasive because of the following reasons:

Applicant argued that applicant's wireless server is capable of executing a plurality of software application program at the server (see Specification, page 39).

In response to applicant's argument, Hiscock teaches a personal wireless network such as wireless link (22) system [see Fig. 1 and Col. 2, Line 60 to Col. 3, Line 12], comprising a wireless server capable of executing any one of a plurality of software applications and generating from such execution a plurality of data packets for transmission in the network. For example, Hiscock discloses a hot-sync server (10) with software running on it for communication with the PDA [see Fig. 1 and Col. 2, Lines 60-66 and Col. 3, Lines 34-43].

In addition, applicant argued that cited reference fails to disclose the generation of a plurality of data packets from the execution of one of the software application programs running on the server (for transmission to and processing by the wireless client) and associates extracted data (extracted from a data packet received from the wireless client) with one of the software application programs.

In response to applicant's argument, Hiscock further teaches a wireless client capable of wireless communication with the wireless server in accordance with at least one wireless communication protocol, the wireless client being configured to remotely access the software applications executed by the wireless server, and to process the data packets transmitted from the wireless server and wherein the wireless server

Art Unit: 2155 Paper Dated 20050513

receives a data packet from the wireless client extracts data from the received data packet, and associates the extracted data with one of the software application. For example, Hiscock discloses one of personal digital assistance (PDA) (12) is coupled to the hot-sync server (10) by a wireless link (22) wherein the hot-sync server includes a wireless transceiver (46) for communicating with the PDA and the PDA also includes a wireless transceiver (36) for communicating with the hot-sync server and wherein software running in the server to allow exchanging packet data between the PDA and the server for establishing connection [see Fig. 2 and Abstract and Col. 3, Lines 21-43 and Col. 4, Lines 5-60].

In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In* re *Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

As a result, cited prior art does disclose a system and method as broadly claimed by the applicant. Applicant has still failed to identify specific claimed limitations that would define a clearly patentable distinction over prior arts. Therefore, the examiner asserts that cited prior art teaches or suggests the subject matter recited in independent claims. Dependent claims are also rejected at least by virtue of dependency on independent claims and by other reasons shown above. Accordingly, claims 1-15 and 20-25 are respectfully rejected.

Art Unit: 2155 Paper Dated 20050513

14. A SHORTENED STATUTORY PERIOD FOR RESPONSE TO THIS ACTION IS SET TO EXPIRE THREE MONTHS FROM THE MAILING DATE OF THIS COMMUNICATION. FAILURE TO RESPOND WITHIN THE PERIOD FOR RESPONSE WILL CAUSE THE APPLICATION TO BECOME ABANDONED (35 U.S.C. § 133). EXTENSIONS OF TIME MAY BE OBTAINED UNDER THE PROVISIONS OF 37 CAR 1.136(A).

- 15. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Philip Tran whose telephone number is (571) 272-3991. The Group fax phone number is (703) 872-9306. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ario Etienne, can be reached on (571) 272-4001.
- 16. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
